

FROM CLINIC TO HOME:

A Scalable Neurorehabilitation Platform Powering Stroke Recovery

CLIENT OVERVIEW

A Singapore-based medical healthcare company specializing in R&D for physio-neuro software solutions, focusing on stroke rehabilitation via mind-body paradigms. The client operates therapy centers across major Indian cities and sought to leverage real-time attention-muscle coordination technology to enhance neuroplasticity outcomes.

THE CHALLENGE

The client faced three core challenges in translating their research into a clinical application:

Complex Signal Processing:

- Required real-time processing of analog EEG/EMG signals ($\leq 70\text{mV}$) from 8 head/arm sensors into digital data.
- Needed advanced DSP expertise for time-domain filtering and sampling.

Scientific Application Gaps:

- No unified platform for therapists to prescribe exercises or track progress using neuroscience principles.
- Patients lacked guided rehabilitation tools.

Fragmented Data Management:

- Decentralized patient records hindered progress analysis.
- No secure synchronization for therapy data across clinics.

OUR APPROACH

MicroGenesis helped to develop a precision scientific application combining hardware integration, real-time analytics, and clinical workflow management:

Real-Time Signal Processing & Visualization

✓ **Hardware Integration:**

8 sensors attached to the patient's head/arm captured EEG/EMG signals during therapy sessions.

✓ **DSP Architecture:**

Analog signals → Sampled via a circuit → Time-domain filtered → Stored in SQLite (lightweight DB).

✓ **Sci-Chart Implementation:**

Rendered millions of data points into high-accuracy real-time graphs for therapist analysis.

End-to-End Clinical Platform

✓ **Therapist Features:**

- Session Planning Module: Prescribe personalized exercises.
- Reporting: Track patient progress via real-time dashboards.

✓ **Patient Features:**

- Play Module: Guided rehabilitation exercises with real-time biofeedback.
- Learn to Play Module: Training for home-based therapy.

✓ **Centralized Data Sync:**

Secure cloud integration for patient records, subscriptions, and therapy history.

Technical Implementation:

✓ **Framework:**

WPF (C#/XAML) for high-performance desktop deployment.

✓ **Value-Adds:**

- Simulators for device-free testing.
- Cross-platform portability (clinics or home laptops).

THE BUSINESS IMPACT

MicroGenesis helped with transformative outcomes in stroke rehabilitation:

AREA	IMPACT
 Therapy Efficiency	End-to-end solution for consultation, prescription, progress tracking, and reporting—reducing manual oversight.
 Data Centralization	Secure, scalable repositories for users across clinics, enabling unified treatment planning.
 Accessibility	Patients could train remotely via a portable Windows application, increasing adherence.
